What is Docker?

- Docker containers wrap a piece of software in a complete filesystem that contains everything needed to run: code, runtime, system tools, system libraries – anything that can be installed on a server. This guarantees that the software will always run the same, regardless of its environment.

What is Docker?

- Lightweight, open source, secure platform
- Simplifies building, shipping, running apps
- Shipping container system for delivering code
- Runs natively on Linux and Windows Server 2016 or higher
- Relies on Images and Containers

What is Docker?

What is Docker?

Servers in Old days

- One application on one physical server.
 - Procurement
 - Capex and Opex costs
 - Costs: Hardware, Power, Administration, etc.
 - Massively Over-Powered Servers with 10% CPU consumption

Virtualization and Hypervisor

- Technology that enables us having Same Physical Server and squeeze so much more
- Instead of one application on one physical server, now multiple application on one physical server.

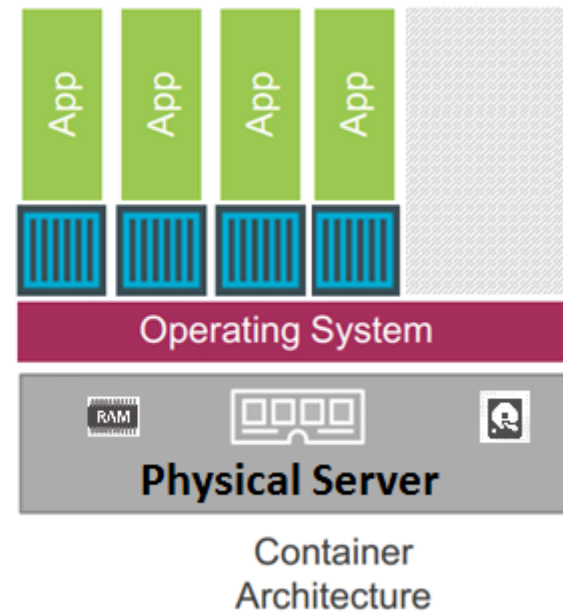

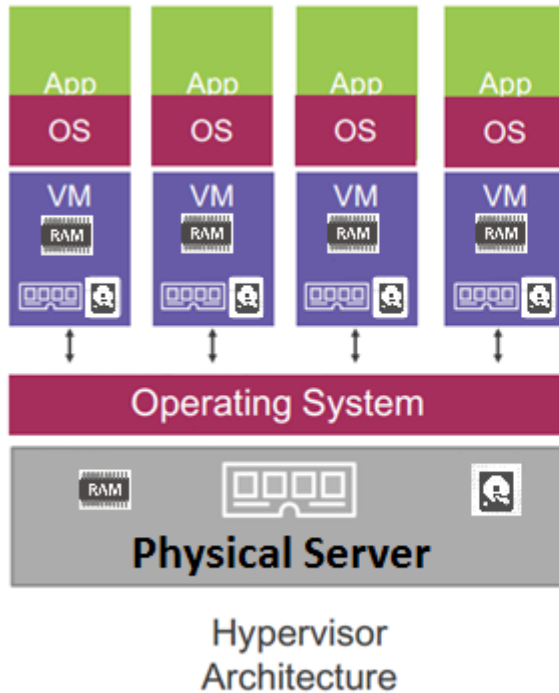

Virtualization Issues

- One physical server
- n virtual machines for n applications
- These vm are slices of physical hardware, e.g. allocating 25% of cpu power, 25% memory, 25% disk space
- These vm are slices of real resources in the physical server
- Each of these vms needs a dedicated OS and each of which uses cpu, memory, and disk
- So far it is just OS and there is no application yet
- Each OS needs license \$\$\$\$
- Each OS needs admin e.g. patching, anti-virus

Docker containers

- Instead of installing Hypervisor and virtual machines, we install only one OS and on top that we create 4 containers. Then applications are running inside each containers.
- Containers are much smaller and more efficient than VMs

Containers vs Virtualization

Docker

- Docker is the containers What Vmwares is to the Hypervisor
- Docker Inc.(the company)
- Docker project: container engine plus Docker tools e.g. Docker client, Docker compose...

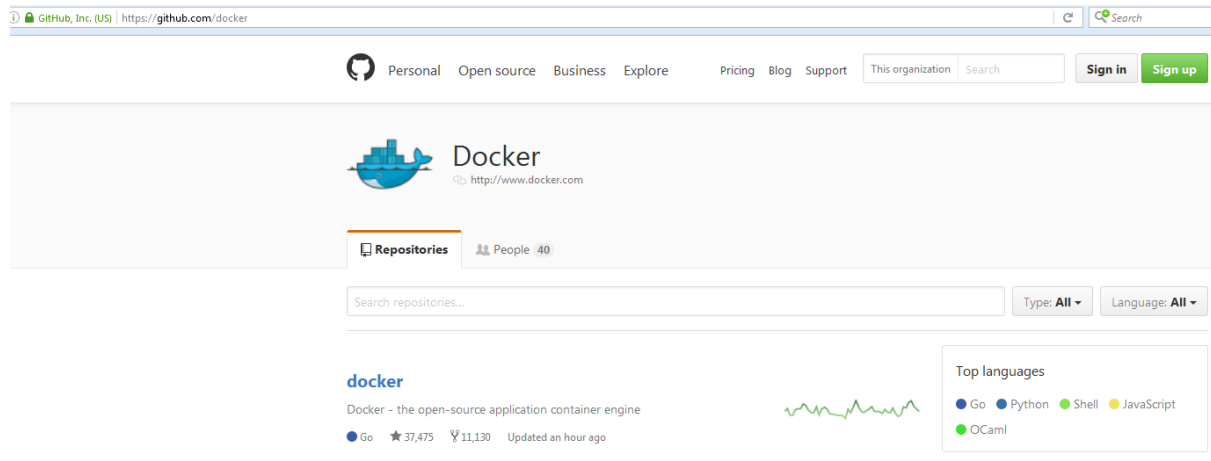

Docker Inc.

- The major company and the main sponsor behind the container technology.
- Tech Starter based on SF
- <https://www.docker.com/company>
- Originally it was dotCloud (platform as a service) and the idea behind that business was to offer the developer platform on top of amazon web service

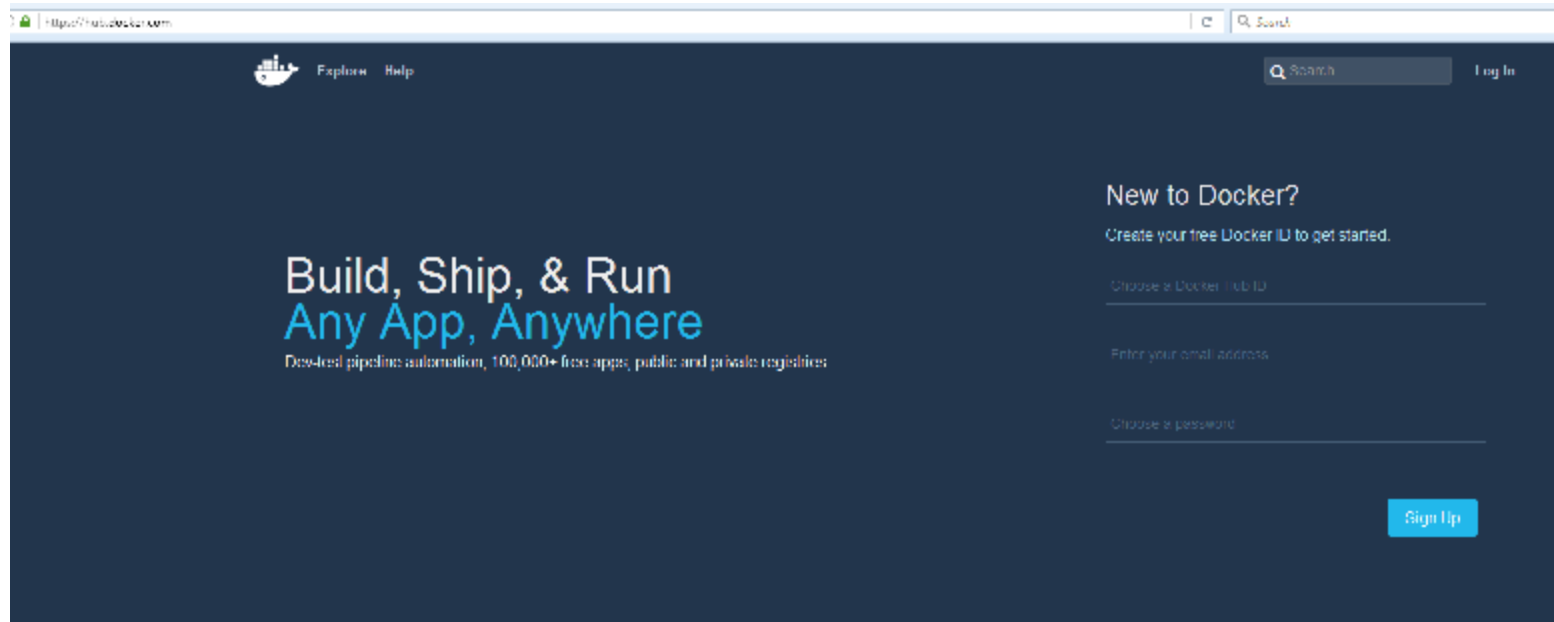

Docker Project

- The Docker project is not absolutely the Docker Inc.
- It belongs to the community.
- Open source under Apache License 2.0
- Core Docker component written in GO language

Docker Hub

- The public Docker registry.
- Place you can store and retrieve Docker images

What is Docker Image?

- Image: is a virtual machine template
 - `docker images`
 - `docker run images-name`
 - `docker stop myDockerMachine`
 - `docker start myDockerMachine`

Agenda

- Docker Containers
- **Docker Benefits for Developers**
- How to use a Docker Client
- ASP.NET Core
- Hooking Your Source Code into a Container
- Demo

Docker Benefits for Developers

- Accelerate Developer Onboarding
- No More App Conflict
- Consistent Environment
- Faster Software Shipment

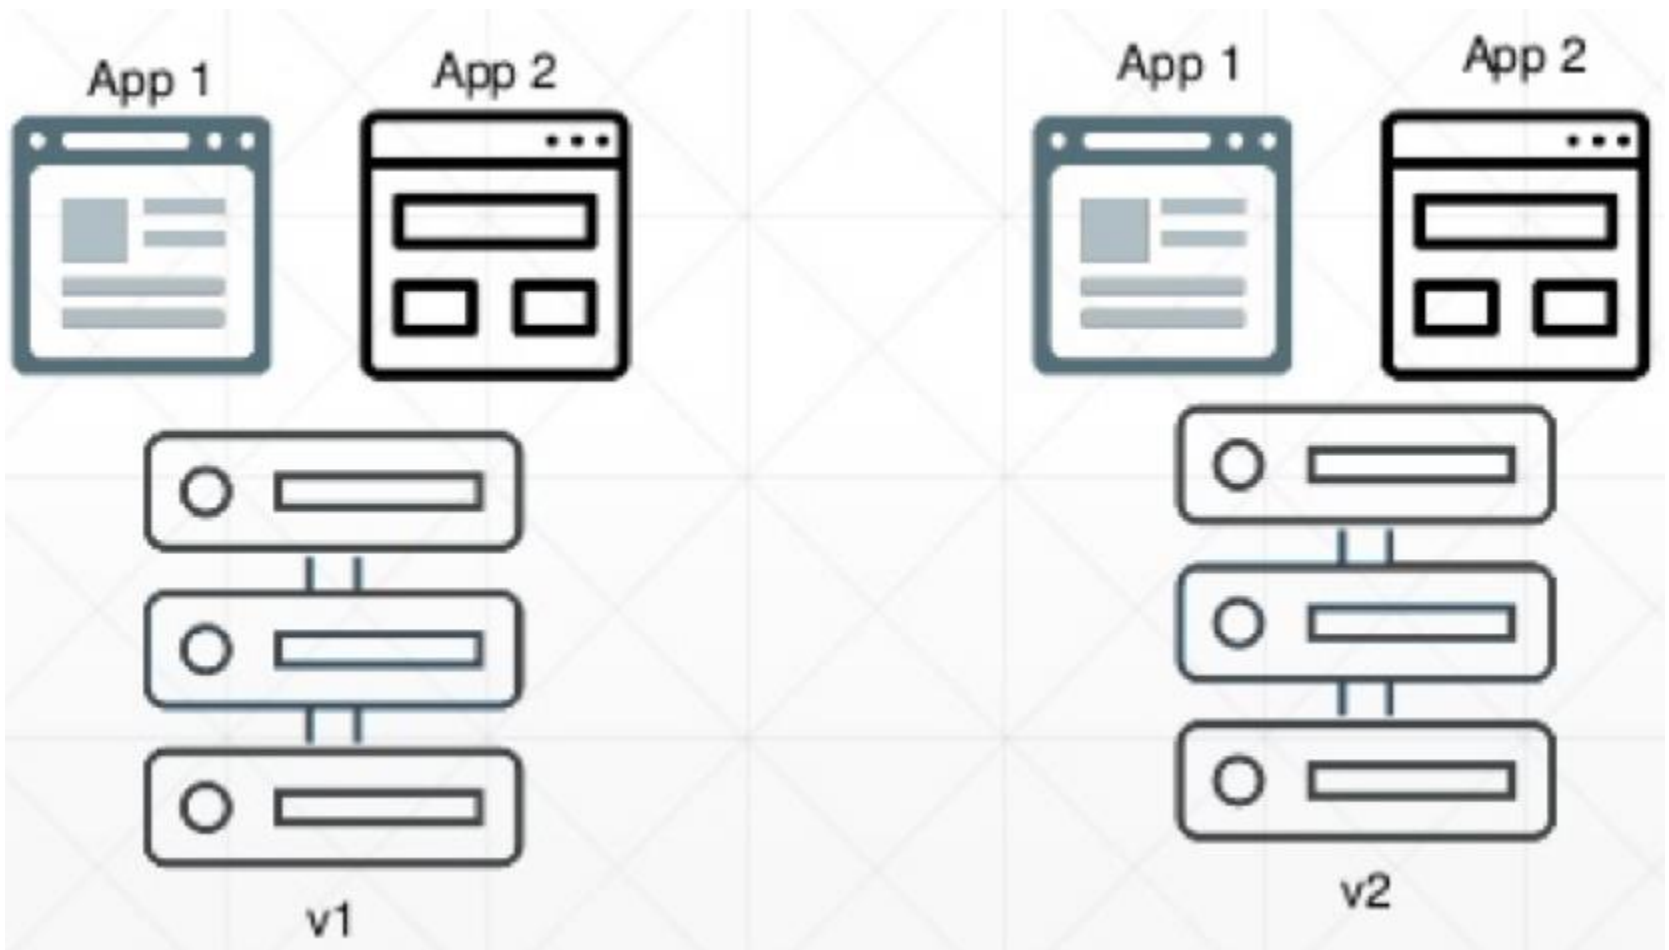

Docker Benefits for Developers

- Accelerate Developer Onboarding

Docker Benefits for Developers

- No More App Conflict

Docker Benefits for Developers

- Consistent Environment

Docker Benefits for Developers

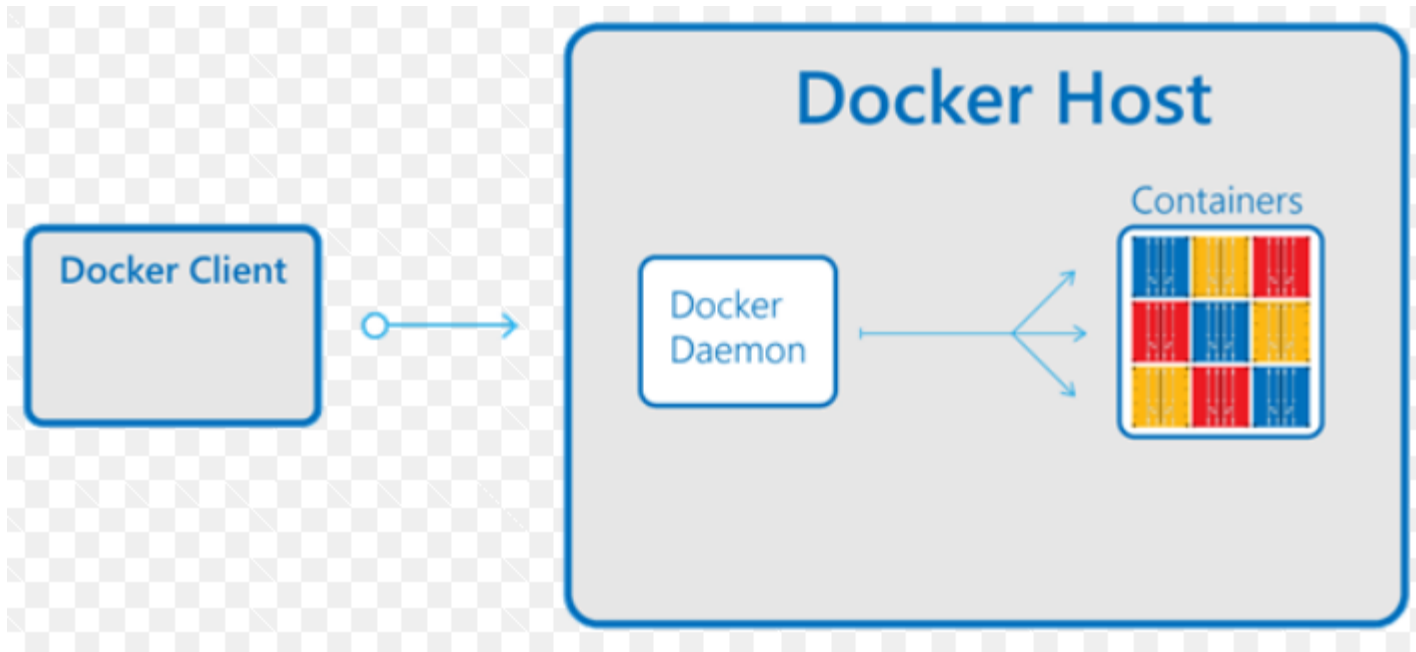

- Faster Software Shipment

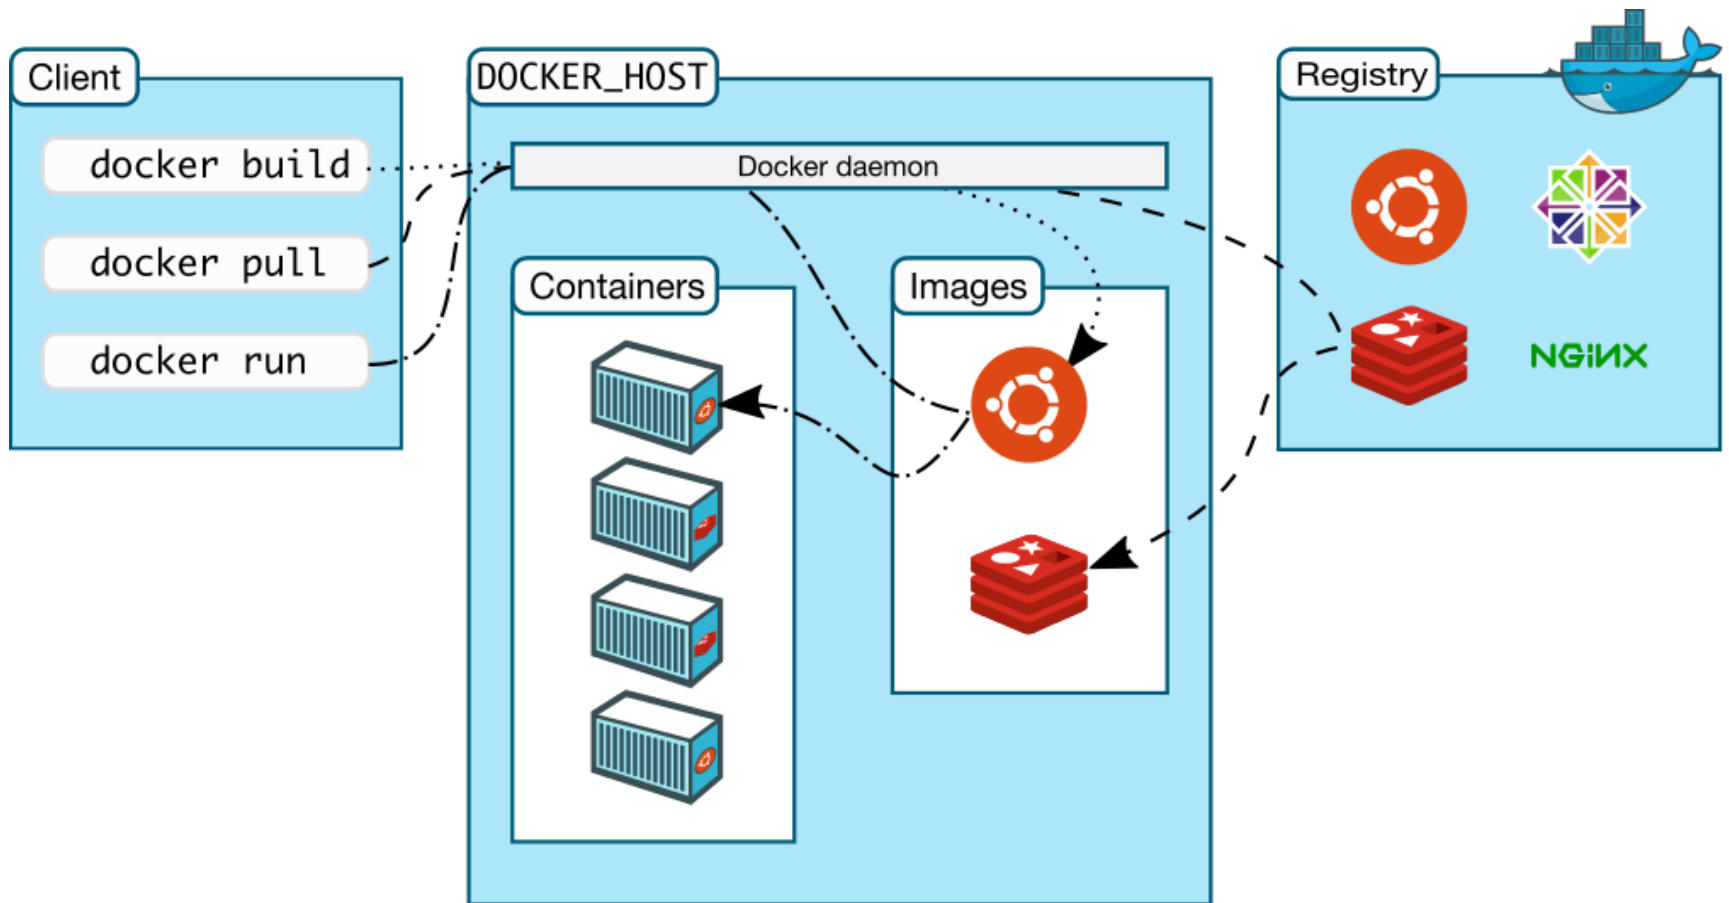

Agenda

- Docker Containers
- Docker Benefits for Developers
- **How to use a Docker Client**
- ASP.NET Core
- Hooking Your Source Code into a Container
- Demo

Docker Client

Docker Client

Docker Client

- Install Ubuntu
- In my machine the host OS is Ubuntu but if you have a windows machine you can install Ubuntu or any other Linux distro using Virtual box.
- Sudo su
- apt-get install -y docker.io
- Docker version => gives both client and server version
- Docker info => give info about containers status and images
- Docker pull IMAGE_NAME=> pull image locally
- Docker images
- Docker run IMAGE_NAME
- Docker ps => list running containers
- Docker ps -a=> list all containers
- Docker stop IMAGE_NAME => stop container
- Docker rm IMAGE_NAME=> remove stopped container
- Docker rmi IMAGE_NAME => remove image from docker host

Agenda

- Docker Containers
- Docker Benefits for Developers
- How to use a Docker Client
- **ASP.NET Core**
- Hooking Your Source Code into a Container
- Demo

ASP.NET Core

- Cross Platform .NET
 - Mono
 - .NET Core

ASP.NET Core

- Mono
 - Mono is an open source implementation of Microsoft's .NET Framework
 - Sponsored by Microsoft
 - Joined the .NET Foundation

Cross platform, open source .NET framework

ASP.NET Core

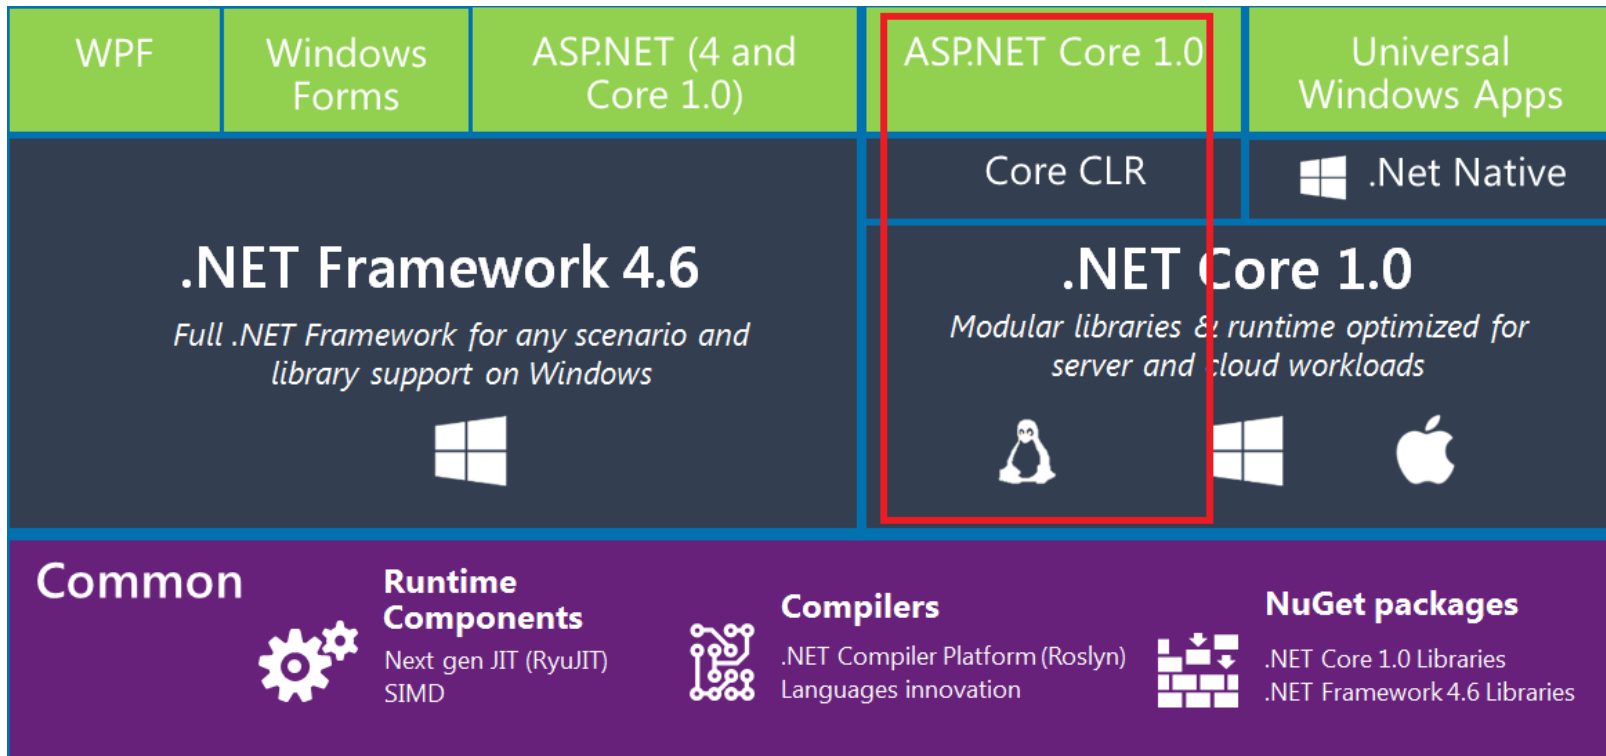

- .NET Core
 - Lightweight open source framework
 - Runs on Windows, Linux, OSX
 - Less features than old .NET Framework

ASP.NET Core

- ASP.NET Core is a lean and composable framework for building web and cloud applications.
- Fully open source and available on [GitHub](#)
- Formerly ASP.NET 5
- Runs on .NET Framework and .NET Core
- Available on Windows, Mac, and Linux

ASP.NET Core

ASP.NET Core

- **ASP.NET Core and Docker**
 - microsoft/dotnet image
 - Official base image for .NET Core applications
 - Based on Debian
 - Uses the “stable” version of .NET Core

ASP.NET Core

microsoft/aspnet - Docker ... x +

Dockerfile

Build Details

Short Description

ASP.NET is an open source server-side Web application framework

Full Description

Supported tags and respective Dockerfile links

- 4.6.2-windowsservercore-10.0.14393.321, 4.6.2-windowsservercore, 4.6.2, latest (4.6.2/Dockerfile)
- 3.5 (3.5/Dockerfile)

These images are updated via [pull requests to the microsoft/aspnet-docker GitHub repo](#).

docker pulls 1M

docker stars 524

What is ASP.NET

ASP.NET is a high productivity framework for building Web Applications using Web Forms, MVC, Web API and SignalR.

This repository contains Dockerfile definitions for ASP.NET Docker images. These images use the [IIS image](#) as their base.

Docker Pull Command

`docker pull microsoft/aspnet`

Owner

 microsoft

Source Repository

- Docker Benefits for Developers
- How to use a Docker Client
- ASP.NET Core
- **Hooking Your Source Code into a Container**
- Demo

Sharing Files

- Image Level: Read only
- Container Level: goes away if container removed
- Data Volume

Volumes

- Data Volume: is a special type of directory in containers. Similar to a network mapped drive.
- Separate from image and containers. Any changes to the image/container won't impact volume.
- They can be shared among other containers e.g. one source code and running multiple instance of the code on different containers.
- Persisted to the Docker host.
- `docker run -p 8080:5000 -v $(pwd):/app microsoft/aspnet`
